**NOTICE**

Read this manual before working with the product. For personal and system safety, and for optimum product performance, make sure to thoroughly understand the contents before installing, using or maintaining this product.

For technical assistance, contacts are listed below:

**Customer Central**
Technical support, quoting, and order-related questions.

**United States** - 1-800-999-9307 (7:00 am to 7:00 pm CST)

**Asia Pacific** - 65 777 8211

**Europe/ Middle East/ Africa** - 49 (8153) 9390

**North American Response Center**
Equipment service needs

1-800-654-7768 (24 hours—includes Canada)

Outside of these areas, contact your local Emerson Process Management representative.

⚠️ **CAUTION**

The products described in this document are NOT designed for nuclear-qualified applications. Using non-nuclear qualified products in applications that require nuclear-qualified hardware or products may cause inaccurate readings.

For information on Rosemount nuclear-qualified products, contact a Emerson Process Management Sales Representative.
**WARNING**

Failure to follow these installation guidelines could result in death or serious injury.

- Make sure only qualified personnel perform the installation.

**Explosions could result in death or serious injury.**

- Installation of this transmitter in an explosive environment must be in accordance with the appropriate local, national, and international standards, codes, and practices. Review the approvals section of the 248 Reference Manual for any restrictions associated with a safe installation.
- Before connecting a Field Communicator in an explosive atmosphere, ensure the instruments are installed in accordance with intrinsically safe or non-incendive field wiring practices.
- Verify the operating atmosphere of the transmitter is consistent with the appropriate hazardous locations certifications.

**Process leaks may cause harm or result in death.**

- Do not remove the thermowell while in operation.
- Install and tighten thermowells and sensors before applying pressure.

**Electrical shock can result in death or serious injury.**

- Avoid contact with the leads and terminals. High voltage that may be present on leads can cause electrical shock.

**This device complies with Part 15 of the FCC Rules. Operation is subject to the following conditions:**

- This device may not cause harmful interference.
- This device must accept any interference received, including interference that may cause undesired operation.
- This device must be installed to ensure a minimum antenna separation distance of 20 cm from all persons.

The power module may be replaced in a hazardous area. The power module has surface resistivity greater than one gigaohm and must be properly installed in the wireless device enclosure. Care must be taken during transportation to and from the point of installation to prevent electrostatic charge build-up.

**NOTICE**

The Rosemount 248 Wireless and all other wireless devices should be installed only after the Smart Wireless Gateway has been installed and is functioning properly. Wireless devices should also be powered up in order of proximity from the Smart Wireless Gateway, beginning with the closest. This will result in a simpler and faster network installation.
NOTICE

Shipping considerations for wireless products (lithium batteries: Green Power Module, model number 701PGNKF):
The unit was shipped to you without the power module installed. Remove the power module prior to shipping the unit.
Each Green Power Module contains one “D” size primary lithium-thionyl chloride battery. Primary lithium batteries are regulated in transportation by the U. S. Department of Transportation, and are also covered by IATA (International Air Transport Association), ICAO (International Civil Aviation Organization), and ARD (European Ground Transportation of Dangerous Goods). It is the responsibility of the shipper to ensure compliance with these or any other local requirements. Consult current regulations and requirements before shipping.

Shipping considerations for wireless products (lithium batteries: Black Power Module, model number 701PBKKF):
The unit was shipped to you without the power module installed. Remove the power module prior to shipping the unit.
Each Black Power Module contains two “C” size primary lithium-thionyl chloride battery. Primary lithium batteries are regulated in transportation by the U. S. Department of Transportation, and are also covered by IATA (International Air Transport Association), ICAO (International Civil Aviation Organization), and ARD (European Ground Transportation of Dangerous Goods). It is the responsibility of the shipper to ensure compliance with these or any other local requirements. Consult current regulations and requirements before shipping.

NOTICE

Power Module Considerations (Green Power Module, model number 701PGNKF):
The Green Power Module with the wireless unit contains one “D” size primary lithium-thionyl chloride battery (model number 701PGNKF). Each battery contains approximately 5.0 grams of lithium. Under normal conditions, the battery materials are self-contained and are not reactive as long as the batteries and the pack integrity are maintained. Care should be taken to prevent thermal, electrical or mechanical damage. Contacts should be protected to prevent premature discharge.
Battery hazards remain when cells are discharged.
Power modules should be stored in a clean and dry area. For maximum power module life, storage temperature should not exceed 30 °C.

Power Module Considerations (Black Power Module, model number 701PBKKF):
The Green Power Module with the wireless unit contains two “C” size primary lithium-thionyl chloride battery (model number 701PGNKF). Each battery contains approximately 2.5 grams of lithium, for a total of 5 grams in each pack. Under normal conditions, the battery materials are self-contained and are not reactive as long as the batteries and the pack integrity are maintained. Care should be taken to prevent thermal, electrical or mechanical damage. Contacts should be protected to prevent premature discharge.
Battery hazards remain when cells are discharged.
Power modules should be stored in a clean and dry area. For maximum power module life, storage temperature should not exceed 30 °C.

Section 1 Introduction

1.1 Using this manual

The sections in this manual provide information on installing, operating, and maintaining the Rosemount 248 Wireless temperature transmitter with WirelessHART® protocol. The sections are organized as follows:

- **Section 2: Configuration** provides instruction on commissioning and operating 248 Wireless Transmitters. Information on software functions, configuration parameters, and online variables is also included.
- **Section 3: Installation** contains mechanical and electrical installation instructions.
- **Section 4: Commissioning** contains techniques for properly commissioning the device.
- **Section 5: Operation and Maintenance** contains operation and maintenance techniques.
- **Section 6: Troubleshooting** provides troubleshooting techniques for the most common operating problems.
- **Appendix A: Specifications and Reference Data** supplies reference and specification data, as well as ordering information.
- **Appendix B: Product Certifications** contains approval information.
- **Appendix C: Mapping for non-DD Based Integration with Host Systems** contains important alerts in the HART® command 48 additional status field for the 248 Wireless Transmitter.

**Rosemount 248 Wireless Transmitter**

Features of the Rosemount 248 Wireless Transmitter include:

- An installation-ready solution that provides a variety of mounting options, transmitter configurations, and sensors/thermowells
- Flexibility to meet your most demanding applications
- Wireless output with >99% data reliability delivers rich HART data, protected by industry leading security
- The integral LCD display conveniently displays the primary sensor input and diagnostics of the transmitter (only available with enclosure option code P)
- Simple and easy installation practices already used today for robust installations

Refer to the following literatures for a full range of compatible connection heads, sensors, and thermowells provided by Emerson Process Management.

- English Temperature Sensors and Assemblies Product Data Sheet, Volume 1 (document number 00813-0100-2654)
- Temperature Sensors and Accessories (Metric Sensors) Product Data Sheet, Volume 2 (document number 00813-0200-2654)
1.2 Safety messages

Instructions and procedures in this section may require special precautions to ensure the safety of the personnel performing the operations. Information that potentially raises safety issues is indicated by a warning symbol (\(^{\text{A}}\)). Refer to the following safety messages before performing an operation preceded by this symbol.

1.2.1 Warnings

⚠️ WARNING

Failure to follow these installation guidelines could result in death or serious injury.
- Make sure only qualified personnel perform the installation.

Explosions could result in death or serious injury.
- Before connecting a Field Communicator in an explosive atmosphere, make sure the instruments are installed in accordance with intrinsically safe or non-incendive field wiring practices.
- Verify that the operating atmosphere of the transmitter is consistent with the appropriate hazardous locations certifications.

Process leaks could result in death or serious injury.
- Do not remove the thermowell while in operation.
- Install and tighten thermowells and sensors before applying pressure.

Electrical shock could cause death or serious injury.
- Avoid contact with the leads and terminals. High voltage that may be present on leads can cause electrical shock.

This device complies with Part 15 of the FCC Rules. Operation is subject to the following conditions.
- This device may not cause harmful interference.
- This device must accept any interference received, including interference that may cause undesired operations.
- This device must be installed to ensure a minimum antenna separation distance of 20 cm from all person.

The power module may be replaced in a hazardous area. The power module has surface resistivity greater than one gigaohm and must be properly installed in the wireless device enclosure. Care must be taken during transportation to and from the point of installation to prevent electrostatic charge build-up.
1.3 Considerations

1.3.1 General

Electrical temperature sensors such as RTDs and thermocouples produce low-level signals proportional to their sensed temperature. With simple HART configuration, the Rosemount 248 Wireless converts the low-level sensor signal to a wireless-enabled signal.

1.3.2 Commissioning

The transmitter can be commissioned before or after installation. It may be useful to commission it on the bench, before installation, to ensure proper operation and to become familiar with its functionality. When applicable, make sure the instruments are installed in accordance with intrinsically safe or non-incendive field wiring practices. The device will be powered whenever the power module is installed. To avoid depleting the power module, make sure it is removed when the device is not in use.

Power up sequence

The power module should not be installed on any wireless device until the Smart Wireless Gateway is installed and functioning properly. Wireless devices should also be powered up in order of proximity from the Smart Wireless Gateway, beginning with the closest. This will result in a simpler and faster network installation. Enable Active Advertising on the Gateway to ensure new devices join the network faster. For more information, see the Smart Wireless Gateway Manual (document number 00809-0200-4420).

Antenna position

Polymer housing (enclosure option code P)

The internal antenna is designed for multiple mounting orientations. The transmitter should be mounted according to best practices for your temperature measurement application. The transmitter should be approximately 3 ft (1 m) from any large structure or building to allow clear communication to other devices.

Aluminum housing (enclosure option code D)

The external antenna should be positioned vertically, either straight up or straight down. The transmitter should be mounted according to best practices for your temperature measurement application. The transmitter should be approximately 3 ft (1 m) from any large structure or building to allow clear communication to other devices.
Conduit entry

Aluminum housing only

Upon installation, ensure that each conduit entry is either sealed with a conduit plug using an approved thread sealant, or has an installed conduit fitting or cable gland with approved threaded sealant.

Network design best practices

When mounting the device, recommended practices should be considered to achieve the best wireless performance. See “Mounting” on page 35 for more information on recommended practices.

Field Communicator connections

Polymer housing

The power module must be installed in the device for the Field Communicator to interface with the Rosemount 248 Wireless Temperature Transmitter. The Field Communicator connections are located on the Green Power Module. To communicate to the transmitter, begin by removing the power module cover. This will expose the HART communication terminals located on the Green Power Module. Next, connect the Field Communicator leads to the COMM port connections on the Green Power Module.
This transmitter uses the Green Power Module; order model number 701PGNKF. The power module is keyed and can only be inserted in one orientation. Field communication with this device requires a HART-based Field Communicator. Refer to Figure 1-3 for instructions on connecting the Field Communicator to the Rosemount 248 Wireless.

Figure 1-3. Field Communicator Connection (Polymer Housing)

Aluminum housing

The power module must be installed in the device for the Field Communicator to interface with the Rosemount 248 Wireless Temperature Transmitter. The Field Communicator connections are located on the terminal block. To communicate to the transmitter, begin by removing the power module-side housing cover, indicated as "Field terminals" by text located on the side of the device. This will expose the terminal block and HART communication terminals. Next, connect the Field Communicator leads to the COMM port connections on the terminal block and connect the Black Power Module to supply power for configuration.

This transmitter uses the Black Power Module; order model number 701PBKKF. The power module is keyed and can only be inserted in one orientation. Field communication with this device requires a HART-based Field Communicator. Refer to Figure 1-4 for instructions on connecting the Field Communicator to the Rosemount 248 Wireless.

Figure 1-4. Field Communicator Connection (Aluminum Housing)
1.3.3 Mechanical

Location

When choosing an installation location and position, take into account the need for access to the mesh network, access to the transmitter and to the power module compartment for ease of power module replacement.

Electronics cover

Polymer housing

The electronics cover is tightened so that polymer contacts polymer. When removing the electronics cover, ensure that there is no damage done to the O-ring. If damaged replace with a Rosemount O-ring before reattaching cover, ensuring polymer contacts polymer (i.e. no O-ring visible).

1.3.4 Electrical

Power module

Polymer housing

The Rosemount 248 Wireless Temperature transmitter is self-powered. The power module contains a primary lithium-thionyl chloride battery (Green Power Module, model number 701PGNKF). Each battery contains approximately 5 grams of lithium. Under normal conditions, the battery materials are self-contained and are not reactive as long as the battery and the power module are maintained. Care should be taken to prevent thermal, electrical, or mechanical damage. Contacts should be protected to prevent premature discharge.

⚠️ Use caution when handling the power module, it may be damaged if dropped from heights in excess of 20 feet.

Battery hazards remain when cells are discharged.

Power modules should be stored in a clean and dry area. For maximum power module life, storage temperature should not exceed 30 °C.

Aluminum housing

The Rosemount 248 Wireless Temperature transmitter is self-powered. The power module contains two “C” size primary lithium/thionyl chloride batteries (Black Power Module, model number 701PBKKF). Each battery contains approximately 2.5 grams of lithium, for a total of 5 grams in each pack. Under normal conditions, the battery materials are self-contained and are not reactive as long as the batteries and the power module integrity are maintained. Care should be taken to prevent thermal, electrical or mechanical damage. Contacts should be protected to prevent premature discharge.

⚠️ Use caution when handling the power module, it may be damaged if dropped from heights in excess of 20 feet.

Battery hazard remain when cell are discharged.
Power modules should be stored in a clean and dry area. For maximum power module life, storage temperature should not exceed 30 °C.

**Sensor**

**Polymer housing**

Make sensor connections with the threaded 1/2-in. NPT connection sensor adapter.

**Aluminum housing**

Make sensor connections through the cable entry in the side of the connection head. Be sure to provide adequate clearance for cover removal.

1.3.5 **Environmental**

Verify that the operating atmosphere of the transmitter is consistent with the appropriate hazardous locations certifications.

**Temperature effects**

The transmitter will operate within specifications for ambient temperatures between –40 and 185 °F (–40 and 85 °C). Heat from the process is transferred from the thermowell to the transmitter housing. If the expected process temperature is near or beyond specification limits, consider the use of additional thermowell and extension, or remote mounting the transmitter to thermally isolate it from the process. See “Mounting” on page 35 for process temperature derating.

1.4 **Service support**

To expedite the return process outside of the United States, contact the nearest Emerson Process Management representative.

Within the United States, call the Emerson Process Management Instrument and Valves Response Center using the 1-800-654-RSMT (7768) toll-free number. This center, available 24 hours a day, will assist you with any needed information or materials.

The center will ask for the following information:

- Product model
- Serial numbers
- The last process material to which the product was exposed

The center will provide:

- A Return Material Authorization (RMA) number
- Instructions and procedures that are necessary to return goods that were exposed to hazardous substances
CAUTION

Individuals who handle products exposed to a hazardous substance can avoid injury if they are informed of and understand the hazard. If the product being returned was exposed to a hazardous substance as defined by OSHA, a copy of the required Material Safety Data Sheet (MSDS) for each hazardous substance identified must be included with the returned goods.

Note

If the device has been exposed to a hazardous substance, a Material Safety Data Sheet (MSDS) must be included with the returned materials. An MSDS is required by law to be available to people exposed to specific hazardous substances.

NOTICE

Shipping considerations for wireless products (lithium batteries: Green Power Module, model number 701PGNKF):

The unit was shipped to you without the power module installed. Remove the power module prior to shipping the unit.

Each Green Power Module contains one “D” size primary lithium-thionyl chloride battery. Primary lithium batteries are regulated in transportation by the U.S. Department of Transportation, and are also covered by IATA (International Air Transport Association), ICAO (International Civil Aviation Organization), and ARD (European Ground Transportation of Dangerous Goods). It is the responsibility of the shipper to ensure compliance with these or any other local requirements. Consult current regulations and requirements before shipping.

1.5

Product recycling/disposal

Recycling of equipment and packaging should be taken into consideration and disposed of in accordance with local and national legislation/regulations.
Section 2  Configuration

2.1  Overview

This section contains information on configuration and verification that should be performed prior to installation.

Field Communicator and AMS® Device Manager instructions are given to perform configuration functions. For convenience, Field Communicator Fast Key sequences are labeled “Fast Keys” for each software function below the appropriate headings.

Sensor Input Trim example

| Fast Key sequence | 1, 2, 3, etc. |

2.2  Safety messages

Instructions and procedures in this section may require special precautions to ensure the safety of the personnel performing the operations. Information that potentially raises safety issues is indicated by a warning symbol ({\textdegree}). Refer to the following safety messages before performing an operation preceded by this symbol.
2.2.1 Warnings

⚠️ WARNING

Failure to follow these installation guidelines could result in death or serious injury.
- Make sure only qualified personnel perform the installation.

Explosions could result in death or serious injury.
- Before connecting a Field Communicator in an explosive atmosphere, make sure the instruments are installed in accordance with intrinsically safe or non-incendive field wiring practices.
- Verify the operating atmosphere of the transmitter is consistent with the appropriate hazardous locations certifications.

Process leaks could result in death or serious injury.
- Do not remove the thermowell while in operation.
- Install and tighten thermowells and sensors before applying pressure.

Electrical shock could cause death or serious injury.
- Avoid contact with the leads and terminals. High voltage that may be present on leads can cause electrical shock.

This device complies with Part 15 of the FCC Rules. Operation is subject to the following conditions:
- This device may not cause harmful interference.
- This device must accept any interference received, including interference that may cause undesired operation.
- This device must be installed to ensure a minimum antenna separation distance of 20 cm from all persons.

The power module may be replaced in a hazardous area. The power module has surface resistivity greater than one gigaohm and must be properly installed in the wireless device enclosure. Care must be taken during transportation to and from the point of installation to prevent electrostatic charge build-up.
2.3 Sensor connections

The Rosemount 248 Wireless Transmitter is compatible with a number of RTD and thermocouple sensor types. Figure 2-1 shows the correct input connections to the sensor terminals on the transmitter. To ensure a proper sensor connection, anchor the sensor lead wires into the appropriate compression terminals and tighten the screws.

Thermocouple or Millivolts inputs

The thermocouple can be connected directly to the transmitter. Use appropriate thermocouple extension wire if mounting the transmitter remotely from the sensor.

RTD or Ohm inputs

The transmitters will accept a variety of RTD or ohmic configurations, including 2-wire, 3-wire or 4-wire connections. If the transmitter is mounted remotely from a 3-wire or 4-wire RTD, it will operate within specifications, without recalibration, for lead wire resistances of up to 5 ohms per lead (equivalent to 500 feet of 20 AWG wire). In this case, the leads between the RTD and transmitter should be shielded. If using a 2-wire connection, both RTD leads are in series with the sensor element, so significant errors can occur if the lead lengths exceed three feet of 20 AWG wire (approximately 0.05 °C/ft.). For longer runs, attach a third or fourth lead to achieve a 3-wire or 4-wire connection as described above.

Effect-RTD input

Since the lead wires are part of the RTD circuit, the lead wire resistance needs to be compensated for to achieve the best accuracy. This becomes especially critical in applications where long sensor and/or lead wires are used. There are three lead wire configurations commonly available. In a two-wire configuration there can be no compensation for lead wire resistance since the lead wires are in series with the element and appear to the transmitter as part of the sensor’s resistance causing inherent accuracy degradation. In a 3-wire configuration, compensation is accomplished using the third wire with the assumption that it will be the same resistance as the other two wires and the same compensation is applied to all three wires. A 4-wire design is ideal because the lead wire resistance is inconsequential to the measurement. It uses a measurement technique where a very small constant current of about 150 micro amps is applied to the sensor through two leads and the voltage developed across the sensor is measured over the other two wires with a high-impedance and high resolution measuring circuit. In accordance with Ohm's Law, the high impedance virtually eliminates any current flow in the voltage measurement leads and therefore the resistance of the leads is not a factor.

Table 2-1. Examples of Approximate Basic Error

<table>

Sensor leads

⚠️ If the sensor is installed in a high-voltage environment and a fault condition or installation error occurs, the sensor leads and transmitter terminals could carry lethal voltages. Use extreme caution when making contact with the leads and terminals.

Use the following steps to wire the sensor and supply power to the transmitter:

**Polymer housing (enclosure option code P)**

1. Remove the power module cover (if applicable).
2. Remove the transmitter enclosure cover (if applicable).
3. Remove the LCD display (if applicable).
4. Loosen the captive screws and Remove LCD adapter plate (if applicable).
5. Attach the sensor leads according to Figure 2-1.
6. Reattach and secure LCD adapter plate to 5 in-lbs of torque (if applicable).
7. Reattach the LCD display (if applicable).
8. Connect the Green Power Module.
9. Verify the connection by observing the LCD display (if applicable).
10. Reattach and tighten the covers (if applicable).
11. Always ensure a proper seal by installing the covers so that polymer contacts polymer (i.e. no O-ring visible). Use Rosemount O-rings.

**Aluminum housing (enclosure option code D)**

1. Remove the transmitter enclosure cover (if applicable).
2. Attach the sensor leads according to the wiring diagrams.
4. Verify the connection.
5. Reattach and tighten the cover (if applicable).
2.4 Bench top configuration

Bench top configuration consists of testing the transmitter and verifying transmitter configuration data. The Rosemount 248 Wireless temperature transmitters must be configured before installation, which may be performed either directly or remotely. Direct configuration can be performed using a Field Communicator, AMS Device Manager, AMS Wireless Configurator, or any WirelessHART® Communicator. Remote configuration can be performed using AMS Device Manager, AMS Wireless Configurator, or the Smart Wireless Gateway.

When using a Field Communicator, any configuration changes made must be sent to the transmitter by using the Send key (F2). AMS configuration changes are implemented when the Apply button is clicked.

Polymer housing

The power module must be installed to provide power to the Rosemount 248 Wireless for configuration. To communicate to the transmitter, begin by removing the power module cover. This will expose the HART communication terminals located on the Green Power Module. Next, connect the Field Communicator leads to the COMM port connections on the Green Power Module.

Aluminum housing

The power module must be installed to provide power to the Rosemount 248 Wireless for configuration. To communicate to the transmitter, begin by removing the power module-side housing cover, indicated as “Field terminals” by text located on the side of the device. This will expose the terminal block and HART communication terminals. Next, connect the Field Communicator leads to the COMM port connections on the terminal block and connect the Black Power Module to supply power for configuration.

Figure 2-6. Field Communicator Connections (Polymer Housing)
Field Communicator

If performing device configuration directly, connect the bench equipment and turn on the Field Communicator by pressing the ON/OFF key. When using a Field Communicator, any configuration changes must be sent to the transmitter by using the Send key (F2).

The Field Communicator will search for a HART®-compatible device and indicate when the connection is made. If the Field Communicator fails to connect, it will indicate that no device was found. If this occurs, refer to Section 6: Troubleshooting.

AMS Device Manager and AMS Wireless Configurator

When configuring the Rosemount 248 Wireless using AMS Device Manager or AMS Wireless Configurator, double click the Rosemount 248 Wireless device icon (or right click and select Con/Setup), then select the Configure Menu. AMS configuration changes are implemented when the Apply button is clicked.

During direct connection configuration, AMS will search for a HART-compatible device and indicate when the connection is made. If AMS fails to connect, it indicates that no device was found. If this occurs, refer to Section 6: Troubleshooting.

Emerson Smart Wireless Gateway

The Rosemount 248 Wireless supports limited remote configuration through the Smart Wireless Gateway. The Gateway allows configuration of the following device parameters: HART Tag, Short Tag, Descriptor, Engineering Units, Update Rate and Range Values.

Device sensor configuration

Every temperature sensor has unique characteristics. In order to ensure the most accurate measurement, the Rosemount 248 Wireless should be configured to match the specific sensor that it will be connected to. Prior to installation, verify the configuration and connection settings of the temperature sensor through a Field Communicator or AMS.
### Default settings

The Rosemount 248 Wireless default configuration is shown below:

<table>
<thead>
<tr>
<th>Sensor Type</th>
<th>Pt 100 (α = 0.00385)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Engineering Units</td>
<td>°C</td>
</tr>
<tr>
<td>Number of Lead Wires</td>
<td>4</td>
</tr>
<tr>
<td>Network ID</td>
<td>Factory Generated Network Parameters</td>
</tr>
<tr>
<td>Join Key</td>
<td>Factory Generated Network Parameters</td>
</tr>
<tr>
<td>Update Rate</td>
<td>1 Minute</td>
</tr>
</tbody>
</table>

**Note**

The C1 option code can be used to enable factory configuration of the Update Rate, Date, Descriptor and Message fields. This code is not required to have the factory configure the Sensor Type, Connection or the Self Organizing Network parameters.

### 2.5 Device network configuration

#### 2.5.1 Join to network

**Polymer housing**

| Fast Keys | 2, 1, 2 |

In order to communicate with the Smart Wireless Gateway, and ultimately the Host System, the transmitter must be configured to communicate over the wireless network. This step is the wireless equivalent of connecting wires from a transmitter to the host system.

1. From the Home screen, select **2: Configure**.
2. Select **1: Guided Setup**.
3. Select **2: Join to Network**.

Using a Field Communicator or AMS to communicate with the transmitter, enter the Network ID and Join Key so they match the Network ID and Join Key of the Smart Wireless Gateway and the other devices in the network. If the Network ID and Join Key are not identical to those set in the Gateway, the transmitter will not communicate with the network. The Network ID and Join Key may be obtained from the Smart Wireless Gateway on the Setup>Network>Settings page on the web server.
**Aluminum housing**

| Fast Keys | 2, 1, 1 |

In order to communicate with the Smart Wireless Gateway, and ultimately the Host System, the transmitter must be configured to communicate over the wireless network. This step is the wireless equivalent of connecting wires from a transmitter to the host system.

1. From the Home screen, select **2: Configure**.
2. Select **1: Guided Setup**.
3. Select **1: Join to Network**.

Using a Field Communicator or AMS to communicate with the transmitter, enter the Network ID and Join Key so they match the Network ID and Join Key of the Smart Wireless Gateway and the other devices in the network. If the Network ID and Join Key are not identical to those set in the Gateway, the transmitter will not communicate with the network. The Network ID and Join Key may be obtained from the Smart Wireless Gateway on the Setup>Network>Settings page on the web server.

### 2.5.2 Configure update rate

**Polymer housing**

| Fast Keys | 2, 1, 3 |

The Update Rate is the frequency at which a new measurement is taken and transmitted over the wireless network. This by default is 1 minute. This may be changed at commissioning, or at any time via AMS. The Update Rate is user selectable from 1 second to 60 minutes.

1. From the Home screen, select **2: Configure**.
2. Select **1: Guided Setup**.
3. Select **3: Configure Update Rate**.

When the device configuration is completed, remove the power module and replace the module cover. The power module should be inserted only when the device is ready to be commissioned. Use caution when handling the power module.
## Aluminum housing

| Fast Keys | 2, 1, 2 |

The Update Rate is the frequency at which a new measurement is taken and transmitted over the wireless network. This by default is 1 minute. This may be changed at commissioning, or at any time via AMS. The Update Rate is user selectable from 1 second to 60 minutes.

1. From the *Home* screen, select **2: Configure**.
2. Select **1: Guided Setup**.
3. Select **2: Configure Update Rate**.

When the device configuration is completed, remove the power module and replace the module cover. The power module should be inserted only when the device is ready to be commissioned. Use caution when handling the power module.

2.5.5 Calibration

Calibrating the transmitter increases the measurement precision by allowing corrections to be made to the factory-stored characterization curve by digitally altering the transmitter’s interpretation of the sensor input.

To understand calibration, it is necessary to understand that smart transmitters operate differently from analog transmitters. An important difference is that smart transmitters are factory-characterized, meaning that they are shipped with a standard sensor curve stored in the transmitter firmware. In operation, the transmitter uses this information to produce a process variable output, in engineering units, dependent on the sensor input.

Calibration of the 248 Wireless may include the following procedure:

- Sensor Input Trim: Digitally alter the transmitter’s interpretation of the input signal

**Trim the transmitter**

The Sensor Input Trim function may be used when calibrating.

**Sensor calibration**

Polymer housing

| Fast Keys | 3, 5, 2 |

Aluminum Housing

| Fast Keys | 3, 4, 1 |

Perform a sensor trim if the transmitters digital value for the primary variable does not match the plant’s standard calibration equipment. The sensor trim function calibrates the sensor to the transmitter in temperature units or raw units. Unless your site-standard input source is NIST-traceable, the trim functions will not maintain the NIST-traceability of the system.

The Sensor Input Trim command allows the transmitter’s interpretation of the input signal to be digitally altered. The sensor reference command trims, in engineering (°F, °C, °R, K) or raw (Ω, mV) units, the combined sensor and transmitter system to a site standard using a known temperature source. Sensor trimming is suitable for validation procedures or for applications that require calibrating the sensor and transmitter together.

Use the following procedure to perform a sensor trim with a Rosemount 248 Wireless:

1. Connect the calibration device or sensor to the transmitter. Refer to Figure 2-1 on page 12 or on the device terminal block for sensor wiring diagrams.
2. Connect the communicator to the transmitter.
3. From the Home screen, select Service Tools>Maintenance>Calibration to prepare to trim the sensor.
4. For polymer housing, select 6 Lower Sensor Trim or 7 Upper Sensor Trim. For aluminum housing, select 3 Lower Sensor Trim or 4 Upper Sensor Trim.
**Note**
It is recommended to perform lower offset trims first, before performing upper slope trims.

5. Answer the question about configuring device for steady state sensor drive.
6. Select the appropriate sensor trim units at the prompt.
7. Adjust the calibration device to the desired trim value (must be within the selected sensor limits). If a combined sensor and transmitter system are being trimmed, expose the sensor to a known temperature and allow the temperature reading to stabilize. Use a bath, furnace or isothermal block, measured with a site-standard thermometer, as the known temperature source.
8. Select OK once the temperature stabilizes. The communicator displays the output value the transmitter associates with the input value provided by the calibration device.

**AMS Device Manager**

For AMS Device Manager, configure the sensor as indicated above.

1. From the Overview screen select the Calibrate button.
2. Select Lower Input Trim or Upper Limit Trim.
3. The wizard will continue through the process.
4. The transmitter may be restored to the factory default by choosing: Service Tools > Maintenance > Sensor Calibration > Recall Factory Trim.
5. The wizard will revert the transmitter to the factory trim for a given sensor.
6. Apply changes.

2.5.6 **Configuring the LCD display**

The LCD Display configuration command allows customization of the LCD to suit application requirements. The LCD will alternate between the selected items.

- Temperature Units
- Sensor Temperature
- % of Range
- Supply Voltage

Reference "LCD screen messages" on page 54 for images of LCD screens.
Enabling and configuring LCD display with a Field Communicator

From the Home screen, enter the Fast Key sequence

| Fast Keys | 2, 1, 5 |

Transmitter ordered with the LCD display will be shipped with the display enabled and installed.

If the transmitter was ordered without the LCD display (and the LCD display was ordered as a spare part) or if the LCD display was disabled, follow these steps to enable the LCD display on the transmitter.

1. From the Home screen, select 2: Configure.
2. Select 1: Guided Setup.
4. Select the option Periodic.
5. Select desired display options and click Enter.

Configuring LCD display with AMS Device Manager

Right click on the device and select Configure.

1. Click on Configure Device Display button under Optional Setup.
2. Select desired display options and click Enter.

2.5.7 Alerts

Polymer housing only

| Fast Keys | 2, 3 |

Alerts allow the user to configure the transmitter to output a HART message when the configured data point is exceeded. A process alert will be transmitter continuously if the set points are exceeded and the alert mode is ON. An alert will be displayed on a Field Communicator, AMS Device Manager status screen or in the error section of the LCD display. The alert will reset once the value returns within range.

Note
HI alert value must be higher than the LO alert value. Both alert values must be within the temperature sensor limits.
To configure the process alerts with a Field Communicator, perform the following procedure:

1. From the HOME screen, follow the Fast Key sequence, **2 Configure, 3 Alert Setup**.
2. Select **1** for HI-HI Alarm, or
3. Select **2** for HI Alarm, or
4. Select **3** for LO Alarm, or
5. Select **4** for LO-LO Alarm.
6. Select **1** to configure the alert.
2.6 Remove power module

After the sensor and network have been configured, remove the Power Module and replace the module cover. The power module should be inserted only when the device is ready to be commissioned. Use caution when handling the power module. The Power Module may be damaged if dropped from heights in excess of 20 feet.
Section 3 Installation

3.1 Safety messages

Instructions and procedures in this section may require special precautions to ensure the safety of the personnel performing the operations. Information that potentially raises safety issues is indicated by a warning symbol (∆). Refer to the following safety messages before performing an operation preceded by this symbol.

3.1.1 Warnings

⚠️ WARNING

Failure to follow these installation guidelines could result in death or serious injury.

- Make sure only qualified personnel perform the installation.

Explosions could result in death or serious injury.

- Installation of this transmitter in an explosive environment must be in accordance with the appropriate local, national, and international standards, codes, and practices. Review the approvals section of the 248 Reference Manual for any restrictions associated with a safe installation.

- Before connecting a Field Communicator in an explosive atmosphere, ensure the instruments are installed in accordance with intrinsically safe or non-incendive field wiring practices.

- Verify the operating atmosphere of the transmitter is consistent with the appropriate hazardous locations certifications.

Process leaks may cause harm or result in death.

- Do not remove the thermowells while in operation.

- Install and tighten thermowells and sensors before applying pressure.

Electrical shock can result in death or serious injury.

Avoid contact with the leads and terminals. High voltage that may be present on leads can cause electrical shock.
3.2 Wireless consideration

3.2.1 Power up sequence

The Rosemount 248 Wireless Transmitter and all other devices should be installed only after the Smart Wireless Gateway (“Gateway”) has been installed and is functioning properly. Wireless devices should also be powered up in order of proximity from the Gateway, beginning with the closest. This will result in a simpler and faster network installation. Enable Active Advertising on the Gateway to ensure new devices join the network faster. For more information see the Emerson Smart Wireless Gateway Manual (document number 00809-0200-4420).

3.2.2 Antenna position

Polymer housing (enclosure option code P)

The internal antenna is designed for multiple mounting orientations. The transmitter should be mounted according to best practices for your temperature measurement application. The transmitter should be approximately 3 ft (1 m) from any large structure or building to allow clear communication to other devices.

Aluminum housing (enclosure option code D)

The external antenna should be positioned vertically, either straight up or straight down. The transmitter should be mounted according to best practices for your temperature measurement application. The transmitter should be approximately 3 ft (1 m) from any large structure or building to allow clear communication to other devices.
3.2.3 Conduit entry

Aluminum housing only

Upon installation, ensure that each conduit entry is either sealed with a conduit plug using an approved thread sealant, or has an installed conduit fitting or cable gland with approved threaded sealant.

3.3 Field Communicator connections

Polymer housing

The power module must be installed in the device for the Field Communicator to interface with the Rosemount 248 Wireless Temperature Transmitter. The Field Communicator connections are located on the Green Power Module. To communicate to the transmitter, begin by removing the power module cover. This will expose the HART® communication terminals located on the Green Power Module. Next, connect the Field Communicator leads to the COMM port connections on the Green Power Module.
This transmitter uses the Green Power Module; order model number 701PGNKF. The power module is keyed and can only be inserted in one orientation. Field communication with this device requires a HART-based Field Communicator. Refer to Figure 3-3 for instructions on connecting the Field Communicator to the Rosemount 248 Wireless.

**Figure 3-3. Field Communicator Connection (Polymer Housing)**

Aluminum housing

The power module must be installed in the device for the Field Communicator to interface with the Rosemount 248 Wireless Temperature Transmitter. The Field Communicator connections are located on the terminal block. To communicate to the transmitter, begin by removing the power module-side housing cover, indicated as "Field terminals" by text located on the side of the device. This will expose the terminal block and HART communication terminals. Next, connect the Field Communicator leads to the COMM port connections on the terminal block and connect the Black Power Module to supply power for configuration.

This transmitter uses the Black Power Module; order model number 701PBKKF. The power module is keyed and can only be inserted in one orientation. Field communication with this device requires a HART-based Field Communicator. Refer to Figure 3-4 for instructions on connecting the Field Communicator to the Rosemount 248 Wireless.

**Figure 3-4. Field Communicator Connection (Aluminum Housing)**
3.4 Mounting

The Rosemount 248 Wireless can be installed in one of two configurations: Direct Mount, where the sensor is connected directly to the 248 Wireless housing’s conduit entry, or Remote Mount, where the sensor is mounted separate from the 248 Wireless housing, then connected to the 248 Wireless via conduit. Choose the installation sequence that corresponds to the mounting configuration.

Figure 3-5 provides an example of the relationship between transmitter housing temperature rise and extension length.

**Figure 3-5. 248 Wireless Transmitter Temperature Rise vs. Extension Length**

![Figure 3-5](image)

**Example**

The transmitter specification limit is 85 °C. If the ambient temperature is 55 °C and the max process temperature to be measured is 815 °C, the maximum permissible temperature rise is the transmitter specification limit minus the ambient temperature (moves 85 to 55 °C), or 30 °C.

In this case, an extension of 5-in. meets this requirement, but 6-in. provides an additional margin of thermowells protection, thereby reducing risk of ambient thermal damage.

**Temperature limits**

3.5 Physical installation

The Rosemount 248 Wireless can be installed in one of two configurations: Direct Mount, where the sensor is connected directly to the 248 Wireless conduit entry, or Remote Mount, where the sensor is mounted separately from the 248 Wireless housing, then connected to the 248 Wireless via conduit. Choose the installation sequence that corresponds to the mounting configuration.

Upon installation of the 248 Wireless, ensure that the conduit entry has an installed conduit fitting or cable gland with approved thread sealant.

3.5.1 Direct mount

Polymer housing

The direct mount installation should not be used when installing with a Swagelok® fitting.

1. Remove the transmitter enclosure cover.
2. Remove the LCD display (if applicable).
3. Loosen the captive screws and remove LCD adapter plate (if applicable).

4. Attach the sensor to the 248 Wireless housing using the threaded conduit entry. Be sure to use an approved thread sealant on all connections.
5. Attach the sensor wiring to the terminals as indicated on Figure 2-1.
6. Reattach and secure LCD adapter plate to 5 in-lbs of torque (if applicable).
7. Reattach the LCD display (if applicable).
8. Reattach and tighten the transmitter enclosure cover.
9. Remove the power module cover.
11. Reattach and tighten the power module cover.
12. Always ensure a proper seal by installing the electronics housing cover(s) so that polymer contacts polymer (i.e. no O-ring visible). Use Rosemount O-rings.

13. Provide 1.75-in. (45 mm) of clearance for units without an LCD display. Provide 3-in. (76 mm) of clearance for units with an LCD display for cover removal.

**Figure 3-7. Direct Mount (Polymer Housing)**

---

**Note**
Wireless devices should be powered up in order of proximity from the Smart Wireless Gateway, beginning with the closest device to the Gateway. This will result in a simpler and faster network installation.

**Aluminum housing**

The direct mount installation should not be used when installing with a Swagelok fitting.

1. Install the sensor according to standard installation practices. Be sure to use an approved thread sealant on all connections.

2. Attach the 248 Wireless housing to the sensor using the threaded conduit entry.

3. Attach the sensor wiring to the terminals as indicated on the wiring diagram.

**Note**
Wireless devices should be powered up in order of proximity from the Smart Wireless Gateway, beginning with the closest device to the Gateway. This will result in a simpler and faster network installation.
5. Close the housing cover and tighten to safety specification. Always ensure a proper seal by installing the electronics housing covers so that metal touches metal, but do not over tighten.

6. Position the antenna vertically, either straight up or straight down. The antenna should be approximately 3 ft (1 m) from any large structures or buildings, to allow clear communication to other devices.

Note
Possible antenna rotation shown. Antenna rotation allows best practices for any configuration.
Remote mount

Polymer housing

1. Remove the transmitter enclosure cover.
2. Remove the LCD display (if applicable).
3. Loosen the captive screws and remove LCD adapter plate (if applicable).

Figure 3-10. Exploded View of LCD Assembly (Polymer Housing)

4. Run wiring (and conduit, if necessary) from the sensor to the 248 Wireless.
5. Pull the wiring through the threaded conduit entry of the 248 Wireless.
6. Attach the sensor wiring to the terminals as indicated on Figure 2-1.
7. Reattach and secure LCD adapter plate to 5 in-lbs of torque (if applicable).
8. Reattach the LCD display (if applicable).
9. Reattach and tighten the transmitter enclosure cover.
10. Remove the power module cover.
11. Connect the Green Power Module.
12. Reattach and tighten the power module cover.
13. Always ensure a proper seal by installing the electronics housing cover(s) so that polymer contacts polymer (i.e. no O-ring visible). Use Rosemount O-rings.
14. Provide 1.75-in. (45 mm) of clearance for units without an LCD display. Provide 3-in. (76 mm) of clearance for units with an LCD display for cover removal.
Figure 3-11. Remote Mount (Polymer Housing)

Note
Wireless devices should be powered up in order of proximity from the Smart Wireless Gateway, beginning with the closest device to the Gateway. This will result in a simpler and faster network installation.

Aluminum housing

1. Install the sensor according to standard installation practices. Be sure to use an approved thread sealant on all connections.

2. Run wiring (and conduit, if necessary) from the sensor to the 248 Wireless.

3. Pull the wiring through the threaded conduit entry of the 248 Wireless.

4. Attach the sensor wiring to the terminals as indicated on the wiring diagram.

5. Connect the Black Power Module.

Note
Wireless devices should be powered up in order of proximity from the Smart Wireless Gateway, beginning with the closest device to the Gateway. This will result in a simpler and faster network installation.
6. Close the housing cover and tighten to safety specification. Always ensure a proper seal by installing the electronics housing covers so that metal touches metal, but do not over tighten.

7. Position the antenna vertically, either straight up or straight down. The antenna should be approximately 3 ft (1 m) from any large structures or buildings to allow clear communication to other devices.

3.5.3 LCD display

**Polymer housing only**

Transmitters ordered with the LCD display will be shipped with the display installed.

The optional LCD display can be rotated in 90-degree increments by squeezing the two tabs, pulling out, rotating and snapping back into place.
Use the following procedure and Figure 3-14 to install the LCD display:

1. Remove the power module cover and Green Power Module
2. Remove the transmitter enclosure cover. Do not remove the instrument covers in explosive environments when the circuit is live.
3. Tighten the captive screws and secure LCD adapter plate to 5 in-lbs of torque.
4. Attach the LCD display on the LCD adapter plate, rotate to the desired position and snap into place.
5. Reattach and tighten the transmitter enclosure cover.
7. Reattach and tighten the power module cover.
8. Always ensure a proper seal by installing the covers so that polymer contacts polymer (i.e. no O-ring visible). Use Rosemount O-rings.

To enable and configure the LCD display, refer to “Configuring the LCD display” on page 27.

Note the following LCD display temperature limits:

- Operating: –40 to 185 °F (–40 to 85 °C)
- Storage: –40 to 185 °F (–40 to 85 °C)

**Note**

Only use Rosemount Wireless LCD Part Number: 00753-3203-0001.

**Note**

A LCD display from a wired device will not function in a wireless device.

**Figure 3-14. Optional LCD Display (Polymer Housing Only)**
3.5.4 Ground the Transmitter

Aluminum housing only

The transmitter will operate with the housing either floating or grounded. However, the extra noise in floating systems affects many types of readout devices. If the signal appears noisy or erratic, grounding the transmitter at a single point may solve the problem.

The electronics enclosure should be grounded in accordance with local and national installation codes. This can be accomplished via the process connection, via the internal case grounding terminal, or via the external grounding terminal.

Thermocouple, mV, and RTD/Ohm inputs

Each process installation has different requirements for grounding. Use the grounding options recommended by the facility for the specific sensor type, or begin with grounding Option 1 (the most common).

Option 1

1. Connect sensor wiring shield to the transmitter housing (only if the housing is grounded).

2. Ensure the transmitter housing is electrically isolated from the sensor wiring.

Figure 3-15. Ground the Transmitter Option 1 (Aluminum Housing)

A. Shield ground point
Option 2

1. Ground sensor wiring shield at the sensor.
2. Ensure that the sensor wiring and shield is electrically isolated from the transmitter housing.

Figure 3-16. Ground the Transmitter Option 2 (Aluminum Housing)

Note
Always use facility recommended wiring practices.
4.1 Safety messages

Instructions and procedures in this section may require special precautions to ensure the safety of the personnel performing the operations. Information that potentially raises safety issues is indicated by a warning symbol (⚠️). Refer to the following safety messages before performing an operation preceded by this symbol.

4.1.1 Warnings

⚠️ WARNING

Failure to follow these installation guidelines could result in death or serious injury.

- Make sure only qualified personnel perform the installation.

Explosions could result in death or serious injury.

- Installation of this transmitter in an explosive environment must be in accordance with the appropriate local, national, and international standards, codes, and practices. Review the approvals section of the 248 Reference Manual for any restrictions associated with a safe installation.
- Before connecting a Field Communicator in an explosive atmosphere, ensure the instruments are installed in accordance with intrinsically safe or non-incendive field wiring practices.
- Verify the operating atmosphere of the transmitter is consistent with the appropriate hazardous locations certifications.

Process leaks may cause harm or result in death.

- Do not remove the thermowells while in operation.
- Install and tighten thermowells and sensors before applying pressure.

Electrical shock can result in death or serious injury.

- Avoid contact with the leads and terminals. High voltage that may be present on leads can cause electrical shock.
**WARNING**

This device complies with Part 15 of the FCC Rules. Operation is subject to the following conditions:

- This device may not cause harmful interference.
- This device must accept any interference received, including interference that may cause undesired operation.
- This device must be installed to ensure a minimum antenna separation distance of 20 cm from all persons.

The power module may be replaced in a hazardous area. The power module has surface resistivity greater than one gigaohm and must be properly installed in the wireless device enclosure. Care must be taken during transportation to and from the point of installation to prevent electrostatic charge build-up.

**Note**

The Rosemount 248 Wireless and all other wireless devices should be installed only after the Smart Wireless Gateway has been installed and is functioning properly. Wireless devices should also be powered up in order of proximity from the Smart Wireless Gateway, beginning with the closest device to the Gateway. This will result in a simpler and faster network installation.
4.2 Verify operations

Polymer housing

Operations can be verified in four locations: at the device via the Local Display, using the Field Communicator, at the Smart Wireless Gateway's integrated web interface, or using AMS® Suite Wireless Configurator or AMS Device Manager.

Local display

During normal operation, the LCD display will display the PV value at the configured update rate.

For Device Status screens, see “LCD screen messages” on page 54.

Aluminum housing

Operations can be verified in three locations: using the Field Communicator, at the Smart Wireless Gateway's integrated web interface, or using AMS Suite Wireless Configurator or AMS Device Manager.

4.2.1 Field Communicator

For HART® Wireless transmitter communication, a Rosemount 248 Wireless DD is required. To obtain the latest DD, visit the Emerson Process Management Easy Upgrade site at:

The communication status may be verified in the wireless device using the following Fast Key sequence.

Table 4-1. Rosemount 248 Wireless Fast Key Sequence (Polymer Housing)

<table>
<thead>
<tr>
<th>Function</th>
<th>Key sequence</th>
<th>Menu items</th>
</tr>
</thead>
<tbody>
<tr>
<td>Communications</td>
<td>3, 4</td>
<td>Comm Status, Join Mode, Available Neighbors, Advertisement, Join Attempts</td>
</tr>
</tbody>
</table>

Table 4-2. Rosemount 248 Wireless Fast Key Sequence (Aluminum Housing)

<table>
<thead>
<tr>

<th>Key sequence</th>
<th>Menu items</th>
</tr>
</thead>
<tbody>
<tr>
<td>Communications</td>
<td>3, 4</td>
<td>Join Status, Communication Status, Join Mode, Number of Available Neighbors, Number of Advisements Heard, Number of Join Attempts</td>
</tr>
</tbody>
</table>
4.2.2 Emerson Smart Wireless Gateway

In the integrated web interface from the Gateway, navigate to the Explorer > Status page. This page shows whether the device has joined the network and if it is communicating properly.

Note
It may take several minutes for the device to join the network.

Note
If the device joins the network and immediately has an alarm present, it is likely due to sensor configuration. Check the sensor wiring (see “Sensor Wiring Diagrams (Polymer Housing)” on page 50) and the sensor configuration (see “Rosemount 248 Wireless Fast Key Sequence (Polymer Housing)” on page 25 and “Rosemount 248 Wireless Fast Key Sequence (Aluminum Housing)” on page 25).

Figure 4-1. Smart Wireless Gateway Network Settings
4.3 **AMS Wireless Configurator**

When the device has joined the network, it will appear in the Wireless Configurator window as illustrated in figure below. For HART Wireless transmitter communication, a Rosemount 248 Wireless DD is required. To obtain the latest DD, visit the Emerson Process Management Easy Upgrade site at:

**Figure 4-2. AMS Wireless Configurator**

4.4 **Troubleshooting**

If the device is not joining to the network, check to make sure that you have a power supply in your device. If the device is not joined to the network after power up, verify the correct configuration of the Network ID and Join Key, and verify that Active Advertising has been enabled on the Smart Wireless Gateway. The Network ID and Join Key in the device must match the Network ID and Join Key of the Gateway.

The Network ID and Join Key may be obtained from the Gateway on the **Setup>Network>Settings** page on the web server (see **Figure 4-1 on page 48**). The Network ID and Join Key may be changed in the wireless device by using the following Fast Key sequence.

<table>

4.5 Reference information

Figure 4-3. Sensor Wiring Diagrams (Polymer Housing)

Note
Emerson Process Management provides 4-wire sensors for all single element RTDs. Use these RTDs in 3-wire or 2-wire configurations by leaving the unneeded leads disconnected and insulated with electrical tape.
Note
Emerson Process Management provides 4-wire sensors for all single element RTDs. Use these RTDs in 3-wire or 2-wire configurations by leaving the unneeded leads disconnected and insulated with electrical tape.

Note
In order to communicate with a Field Communicator, the device must be powered by connecting the power module.

Section 5 Operation and Maintenance

5.1 Safety messages

Instructions and procedures in this section may require special precautions to ensure the safety of the personnel performing the operations. Information that potentially raises safety issues is indicated by a warning symbol (▲). Refer to the following safety messages before performing an operation preceded by this symbol.

5.1.1 Warnings

▲ WARNING

Failure to follow these installation guidelines could result in death or serious injury.
- Make sure only qualified personnel perform the installation.

Explosions could result in death or serious injury.
- Installation of this transmitter in an explosive environment must be in accordance with the appropriate local, national, and international standards, codes, and practices. Review the approvals section of the 248 Reference Manual for any restrictions associated with a safe installation.
- Before connecting a Field Communicator in an explosive atmosphere, ensure the instruments are installed in accordance with intrinsically safe or non-incendive field wiring practices.
- Verify the operating atmosphere of the transmitter is consistent with the appropriate hazardous locations certifications.

Process leaks may cause harm or result in death.
- Do not remove the thermowells while in operation.
- Install and tighten thermowells and sensors before applying pressure.

Electrical shock can result in death or serious injury.
- Avoid contact with the leads and terminals. High voltage that may be present on leads can cause electrical shock.

This device complies with Part 15 of the FCC Rules. Operation is subject to the following conditions:
- This device may not cause harmful interference.
- This device must accept any interference received, including interference that may cause undesired operation.
- This device must be installed to ensure a minimum antenna separation distance of 20 cm from all persons.

The power module may be replaced in a hazardous area. The power module has surface resistivity greater than one gigaohm and must be properly installed in the wireless device enclosure. Care must be taken during transportation to and from the point of installation to prevent electrostatic charge build-up.
5.2 LCD screen messages

Polymer housing only

5.2.1 Startup screen sequence

The following screens will display when the power module is first connected to the Rosemount 248 Wireless.

<table>
<thead>

</tr>
</tbody>
</table>
**SV Screen:** terminal temperature value

**TV Screen:** device temperature value

**QV Screen:** voltage reading at the power supply terminals

**Percent Range Screen:** percent range reading

**Alert Screen:** at least one alert is present - this screen will not display if no alerts are present

---

**Note**
Use the Rosemount Wireless LCD Part Number: 00753-3203-0001.
5.3 **Power module replacement**

Expected power module life is 10 years at reference conditions.\(^{(1)}\)

**Polymer housing**

When power module replacement is required, remove the cover and remove the Green Power Module. Replace the Green Power Module (part number 701PGNKF) and replace the cover. Tighten to specification and verify operation.

*Figure 5-1. Exploded Power Module View (Polymer Housing)*

**Aluminum housing**

When power module replacement is required, remove the cover on the field terminal side and remove the Black Power Module. Replace the Black Power Module (part number 701PBKKF) and replace the cover. Tighten to specifications and verify operation.

*Figure 5-2. Exploded Power Module View (Aluminum Housing)*

---

\(^{(1)}\) Reference conditions are 70°F (21°C), transmit rate of once per minute, and routing data for three additional network devices.
5.3.1 Handling considerations

**Polymer housing**

The Green Power Module with the wireless unit contains one “D” size primary lithium-thionyl chloride battery (Green Power Module, model number 701PGNKF). Each battery contains approximately 5.0 grams of lithium. Under normal conditions, the battery materials are self-contained and are not reactive as long as the batteries and the pack integrity are maintained. Care should be taken to prevent thermal, electrical or mechanical damage.

Contacts should be protected to prevent premature discharge.

Power modules should be stored in a clean and dry area. For maximum power module life, storage temperature should not exceed 30 °C.

Use caution when handling the power module, it may be damaged if dropped from heights in excess of 20 feet.

⚠️ Battery hazards remain when cells are discharged.

**Aluminum housing**

Each Green Power Module with the wireless unit contains two “C” size primary lithium/thionyl chloride batteries (Black Power Module, module number 701PBKKF). Each battery contains approximately 2.5 grams of lithium, for a total of 5 grams in each pack. Under normal conditions, the battery and the pack integrity are maintained. Care should be taken to prevent thermal, electrical or mechanical damage.

Contacts should be protected to prevent premature discharge.

Power modules should be stored in a clean and dry area. For maximum power module life, storage temperature should not exceed 30 °C.

Use caution when handling the power module, it may be damaged if dropped from heights in excess of 20 feet.

⚠️ Battery hazards remain when cells are discharged.

5.3.2 Environmental considerations

As with any battery, local environmental rules and regulations should be consulted for proper management of spent batteries. If no specific requirements exist, recycling through a qualified recycler is encouraged. Consult the material’s safety data sheet for battery specific information.

5.3.3 Shipping considerations

The unit was shipped to you without the power module installed. Remove the power module prior to shipping the unit.
Section 6 Troubleshooting

6.1 Overview

Table 6-2 provides summarized maintenance and troubleshooting suggestions for the most common operating problems. If you suspect malfunction despite the absence of any diagnostic messages on the Field Communicator display, follow the procedures described here to verify that transmitter hardware and process connections are in good working order. Always deal with the most likely checkpoints first.

6.2 Safety messages

Procedures and instructions in this section may require special precautions to ensure the safety of the personnel performing the operations. Information that raises potential safety issues is indicated by a warning symbol (⚠️). Refer to the following safety messages before performing an operation preceded by this symbol.
6.2.1 Warnings

**WARNING**

Failure to follow these installation guidelines could result in death or serious injury.

- Make sure only qualified personnel perform the installation.

**Explosions could result in death or serious injury.**

- Installation of this transmitter in an explosive environment must be in accordance with the appropriate local, national, and international standards, codes, and practices. Review the approvals section of the 248 Reference Manual for any restrictions associated with a safe installation.
- Before connecting a Field Communicator in an explosive atmosphere, ensure the instruments are installed in accordance with intrinsically safe or non-incendive field wiring practices.
- Verify the operating atmosphere of the transmitter is consistent with the appropriate hazardous locations certifications.

**Process leaks may cause harm or result in death.**

- Do not remove the thermowells while in operation.
- Install and tighten thermowells and sensors before applying pressure.

**Electrical shock can result in death or serious injury.**

- Avoid contact with the leads and terminals. High voltage that may be present on leads can cause electrical shock.

**This device complies with Part 15 of the FCC Rules. Operation is subject to the following conditions:**

- This device may not cause harmful interference.
- This device must accept any interference received, including interference that may cause undesired operation.
- This device must be installed to ensure a minimum antenna separation distance of 20 cm from all persons.

The power module may be replaced in a hazardous area. The power module has surface resistivity greater than one gigaohm and must be properly installed in the wireless device enclosure. Care must be taken during transportation to and from the point of installation to prevent electrostatic charge build-up.
### Table 6-1. Rosemount 248 Wireless Device Status Information

<table>
<thead>
<tr>
<th>Device status</th>
<th>Description</th>
<th>Recommended action</th>
</tr>
</thead>
</table>
| Electronics Failure                    | An electronics error that could impact the device measurement reading has occurred. | 1. Reset the device.  
2. Reconfirm all configuration items in the device.  
3. If the condition persists, replace the electronics. |
| Radio Failure                          | The wireless radio has detected a failure or stopped communicating.          | 1. Reset the device.  
2. If the condition persists, replace the electronics. |
| Supply Voltage Failure                  | The supply voltage is too low for the device to function properly.          | 1. Replace the power module.                                                        |
| Electronics Warning                    | The device has detected an electronics error that does not currently impact the device measurement reading. | 1. Reset the device.  
2. Reconfirm all configuration items in the device.  
3. If the condition persists, replace the electronics. |
| Electronics Temperatures has Exceeded Limits | The electronics temperature has exceeded the transmitter’s maximum range.     | 1. Verify environmental temperature is within the transmitter’s range.  
2. Remote mount the transmitter away from process and environmental conditions.  
3. Reset the device.  
4. If the condition persists, replace the electronics. |
| Supply Voltage Low                      | The supply voltage is low and may soon affect broadcast updates.            | 1. Replace the power module.                                                        |
| Database Memory Warning                 | The device has failed to write to the database memory. Any data written during this time may have been lost. | 1. Reset the device.  
2. Reconfirm all configuration items in the device.  
3. If logging dynamic data not needed, this advisory can be safely ignored.  
4. If the condition persists, replace the electronics. |
| Configuration Error                     | The device has detected a configuration error based on a change to the device. | 1. Click on details for more information.  
2. Correct the parameter that has a configuration error.  
3. Reset the device.  
4. If the condition persists, replace the electronics. |
| HI HI LIM                               | The primary variable has surpassed the user defined limit.                   | 1. Verify the process variable is within user specified limits.  
2. Reconfirm the user defined alarm limit.  
3. If not needed, disable this alert. |
| HI LIM                                 | The primary variable has surpassed the user defined limit.                   | 1. Verify the process variable is within user specified limits.  
2. Reconfirm the user defined alarm limit.  
3. If not needed, disable this alert. |
| LO LIM                                 | The primary variable has surpassed the user defined limit.                   | 1. Verify the process variable is within user specified limits.  
2. Reconfirm the user defined alarm limit.  
3. If not needed, disable this alert. |
| LO LO LIM                              | The primary variable has surpassed the user defined limit.                   | 1. Verify the process variable is within user specified limits.  
2. Reconfirm the user defined alarm limit.  
3. If not needed, disable this alert. |
| Simulation Active                      | The device is in simulation mode and may not be reporting actual information. | 1. Verify that simulation is no longer required.  
2. Disable Simulation mode in Service Tools.  
3. Reset the device. |

</table>
Appendix A Specifications and Reference Data

A.1 Specifications

A.1.1 Functional specifications

Input

Supports Thermocouple, RTD, millivolt and ohm input types. See “Accuracy” on page 66 for sensor options.

Output

IEC 62591 (WirelessHART®, 2.4 GHz DSSS.

Wireless radio (WP5 and WK1 options)

Frequency: 2.4 - 2.4835 GHz
Channels: 15
Modulation: IEEE 802.15.4 compliant DSSS

Local display (Polymer housing only)

The optional five-digit integral LCD can display user-selectable information such as primary variable in engineering units, percent of range, and electronics temperature. The display updates based on the wireless update rate.

Humidity limits

0–99% relative humidity (non-condensing)

Update rate

WirelessHART, User selectable, 1 sec. to 60 min.

Accuracy

(PT 100 @ reference conditions: 20 °C)
±0.45 °C (±0.81 °F)
A.1.2 Physical specifications

Conformance to specification ($\pm 3\sigma$ (Sigma))

Technology leadership, advanced manufacturing techniques, and statistical process control ensure specification conformance to at least $\pm 3\sigma$.

Electrical connections

Power module

The Emerson SmartPower™ Power Module is field replaceable, featuring keyed connections that eliminate the risk of incorrect installation.

The power module is an Intrinsically Safe solution, containing lithium-thionyl chloride with a polybutadine terephthalate (PBT) enclosure.

The 248 Wireless has a power module life time rating of 10 years with a one-minute update rate at reference conditions. (1)

Note

Continuous exposure to ambient temperature limits of -40 °F or 185 °F (-40 °C or 85 °C) may reduce specified life by less than 20 percent.

Sensor terminals

Sensor terminals permanently fixed to terminal block.

Field Communicator connections

Communication terminals

HART® interface connections fixed to the Green Power Module. (polymer housing)

Clips permanently fixed to terminal block, designated by the text “COMM”. (aluminum housing)

Materials of construction

Enclosure

Housing: PBT/PC with NEMA 4X and IP66/67 (polymer housing)

Low-copper aluminum with NEMA 4X and IP66/67 (aluminum housing)

Paint: Polyurethane (aluminum housing)

Cover O-ring: Silicone (polymer housing)

Buna-N (aluminum housing)

Antenna

PBT/PC integrated omni-directional antenna (aluminum housing)

Mounting

Transmitters may be attached directly to the sensor. Mounting brackets also permit remote mounting. See “Dimensional drawings” on page 70.

(1) Reference conditions are 70 °F (21 °C) and routing data for three additional network devices.

Note: Continuous exposure to ambient temperature limits of -40 °F or 185 °F (−40 °C or 85 °C) may reduce specified life by less than 20 percent.
**Weight**

**Engineered polymer**

248 Wireless without M5 LCD display: 0.99 lb. (0.45 kg)
248 Wireless with M5 LCD display: 1.11 lb. (0.51 kg)

**Aluminum**

3.03 lb. (1.38 kg)

**Enclosure ratings (Rosemount 248 Wireless)**

NEMA 4X and IP66/67

### A.1.3 Performance specifications

**Electro Magnetic Compatibility (EMC)**

The 248 Wireless meets all requirements listed under IEC 61326 and NAMUR NE-21.

**Transmitter measurement stability**

The 248 Wireless has a stability of ±0.15% of output reading or 0.15 °C (whichever is greater) for 12 months.

**Self calibration**

The analog-to-digital measurement circuitry automatically self-calibrates for each temperature update by comparing the dynamic measurement to extremely stable and accurate internal reference elements.

**Vibration effect**

The 248 Wireless (direct and remote mounted with enclosure option code D and direct mounted with enclosure option code P) are tested to the following specifications with no effect on performance per IEC 60770-1, 1999:

<table>
<thead>
<tr>
<th>Frequency</th>
<th>Acceleration</th>
</tr>
</thead>
<tbody>
<tr>
<td>10-60 Hz</td>
<td>0.21 mm peak displacement</td>
</tr>
<tr>
<td>60-2000Hz</td>
<td>3 g</td>
</tr>
</tbody>
</table>

The 248 Wireless (remote mounted with enclosure option code P) is tested to the following specifications with no effect on performance per IEC 60770-1, 1999:

<table>
<thead>
<tr>
<th>Frequency</th>
<th>Acceleration</th>
</tr>
</thead>
<tbody>
<tr>
<td>10-60 Hz</td>
<td>0.15 mm peak displacement</td>
</tr>
<tr>
<td>60-500Hz</td>
<td>2 g</td>
</tr>
</tbody>
</table>

</tbody>
</table>
Transmitters can be installed in locations where the ambient temperature is between –40 and 85 °C (–40 and 185 °F). In order to maintain excellent accuracy performance, each transmitter is individually characterized over this ambient temperature range at the factory.

**Temperature effects example**

When using a Pt 100 (α = 0.00385) sensor input at 30 °C ambient temperature:

- Digital Temperature Effects: 0.009 °C × (30 - 20) = 0.09 °C
- Worst Case Error: Digital + Digital Temperature Effects = 0.45 °C + 0.09 °C = 0.54 °C
- Total Probable Error: \( \sqrt{0.45^2 + 0.09^2} = 0.459 \) °C

<tr>
<td>RTD Resistance at 0 °C (R₀)</td>
<td>100 Ω (for Pt 100 RTD)</td>
</tr>
</tbody>
</table>

- Pt100 4-wire RTD: Negligible (independent of lead wire resistance up to 5Ω per lead)
- Pt100 3-wire RTD:
  
  Basic Error = \( \frac{\text{Imbalance of Lead wires}}{(αₚₚ x R₀)} \)

  Error due to amb. temperature variation = \( \frac{(α_{Cu}) \times (ΔT_{amb}) \times (\text{Imbalance of Lead wires})}{(αₚₚ x R₀)} \)

  Lead wire imbalance seen by the transmitter = 0.5 Ω

  Basic Error = \( \frac{0.5 \Omega}{{(0.00385 \Omega/°C) \times (100 \Omega)}} \) = 1.3 °C

  Error due to amb. temp. var. of ±25 °C = \( \frac{(0.0039 \Omega/°C) \times (25 °C) \times (0.5 \Omega)}{{(0.00385 \Omega/°C) \times (100 \Omega)}} \) = ±0.1266 °C

- Pt100 2-wire RTD:
  
  Basic Error = \( \frac{\text{Imbalance of Lead wires}}{(αₚₚ x R₀)} \)

  Error due to amb. temperature variation = \( \frac{(α_{Cu}) \times (ΔT_{amb}) \times (\text{Lead Wire Resistance})}{(αₚₚ x R₀)} \)

  Lead wire resistance seen by the transmitter = 150 m x 2 wires x 0.025 Ω/m = 7.5 Ω

  Basic Error = \( \frac{7.5 \Omega}{{(0.00385 \Omega/°C) \times (100 \Omega)}} \) = 19.5 °C

  Error due to amb. temp. var. of ±25 °C = \( \frac{(0.0039 \Omega/°C) \times (25 °C) \times (7.5 \Omega)}{{(0.00385 \Omega/°C) \times (100 \Omega)}} \) = ± 1.9 °C

<sup>(3)</sup> When ordering a Rosemount 248 wireless with the XA option, a mounting bracket is not included. If a bracket is required, order option code B5.
<sup>(4)</sup> Green Power Module must be shipped separately, order Model 701PGNKF.
<sup>(5)</sup> Black Power Module must be shipped separately, order Model 701PBKKF.
Appendix B  Product Certifications

B.1  Approved Manufacturing Locations

Rosemount Inc. - Chanhassen, Minnesota, USA
Fisher-Rosemount GmbH & Co. - Wessling, Germany
Emerson Process Management Asia Pacific Private Limited - Singapore

B.2  European Directive Information

A copy of the EC Declaration of Conformity can be found at the end of the Quick Start Guide. The most recent revision of the EC Declaration of Conformity can be found at www.rosemount.com.

B.3  Ordinary Location Certification

As standard, the transmitter has been examined and tested to determine that the design meets the basic electrical, mechanical, and fire protection requirements by a nationally recognized test laboratory (NRTL) as accredited by the Federal Occupational Safety and Health Administration (OSHA).

B.4  Telecommunication Compliance

All wireless devices require certification to ensure they adhere to regulations regarding the use of the RF spectrum. Nearly every country requires this type of product certification. Emerson is working with governmental agencies around the world to supply fully compliant products and remove the risk of violation country directives or laws governing wireless devices usage.

B.5  FCC and IC

This device complies with Part 15 of the FCC Rules. Operation is subject to the following conditions: This devices may not cause harmful interference, this devices must accept any interference received, including interference that may cause undesired operation. This device must be installed to ensure a minimum antenna separation distance of 20 cm from all persons.
B.6 Installing Equipment in North America

The US National Electrical Code (NEC) and the Canadian Electrical Code (CEC) permit the use of Division marked equipment in Zones and Zone marked equipment in Divisions. The markings must be suitable for the area classification, gas, and temperature class. This information is clearly defined in the respective codes.

USA

I5 USA Intrinsically Safe
Certificate: 70008071 (Polymer housing)
Markings: Intrinsically Safe: CL I, DIV 1, GP A, B, C, D; CL I, DIV 2, GP A, B, C, D; Class I, Zone 0, AEx ia IIC T4/T5 Ga; T4(-50 °C ≤ Ta ≤ +70 °C), T5(-50 °C ≤ Ta ≤ +40 °C) when installed per Rosemount drawing 00249-2020; TYPE 4X, IP66/67
See Table B-1 at the end of the Product Certifications section for Entity Parameters.

Special Condition for Safe Use (X):
1. Battery Exchange: The battery module can be change inside hazardous gas-explosive locations. During battery change it must be assured that the connections are free from dust or dirt.

I5 USA Intrinsically Safe

Europe

I1  ATEX Intrinsic Safety
Certificate: Baseefa14ATEX0359X (Polymer housing)
Markings: II 1 G Ex ia IIC T4/T5 Ga; T4(-60 °C ≤ T_a ≤ +70 °C); T5(-60 °C ≤ T_a ≤ +40 °C)
See Table B-1 at the end of the Product Certifications section for Entity Parameters.

Special Condition for Safe Use (X):
1. The plastic enclosure may present a potential electrostatic ignition hazard and must not
be rubbed or cleaned with a dry cloth.

I1  ATEX Intrinsic Safety
Certificate: Baseefa10ATEX0121X (Aluminum housing)
Markings: II 1 G Ex ia IIC T4/T5 Ga; T4(-60 °C ≤ T_a ≤ +70 °C); T5(-60 °C ≤ T_a ≤ +40 °C);
See Table B-1 at the end of the Product Certifications section for Entity Parameters

Special Conditions for Safe Use (X):
1. The plastic antenna may present a potential electrostatic ignition hazard and must not be
rubbed or cleaned with a dry cloth.
2. The Model 248 enclosure may be made of aluminum alloy and given a protective
polyurethane paint finish; however, care should be taken to protect it from impact or
abrasion if located in a Zone 0 area.
International

I7  IECEx Intrinsic Safety
Certificate: IECEx BAS 14.0158X (Polymer housing)
Markings: Ex ia IIC T4/T5 Ga, T4(-60 °C ≤ Ta ≤ +70 °C), T5(-60 °C ≤ Ta ≤ +40 °C);
See Table B-1 at the end of the Product Certifications section for Entity Parameters.

Special Condition for Safe Use (X):
1. The plastic enclosure may present a potential electrostatic ignition hazard and must not be rubbed or cleaned with a dry cloth.

I7  IECEx Intrinsic Safety
Certificate: IECEx BAS 10.0059X (Aluminum housing)
Markings: Ex ia IIC T4/T5 Ga, T4(-60 °C ≤ Ta ≤ +70 °C), T5(-60 °C ≤ Ta ≤ +40 °C);
See Table B-1 at the end of the Product Certifications section for Entity Parameters.

Special Conditions for Safe Use (X):
1. The surface resistivity of the antenna is greater than 1GΩ. To avoid electrostatic charge build-up, it must not be rubbed or cleaned with solvents or a dry cloth.
2. The Model 701PBKKF Power Module and Intelligent Power Module 71008 may be replaced in a hazardous area. The Power modules have a surface resistivity greater than 1GΩ and must be properly installed in the wireless device enclosure. Care must be taken during transportation to and from the point of installation to prevent electrostatic charge build-up.
3. The Model 248 enclosure may be made of aluminum alloy and given a protective polyurethane paint finish; however, care should be taken to protect it from impact or abrasion if located in a Zone 0 area.

Mapping for non-DD Based Integration with Host Systems

C.1 Mapping of alert messages in the HART command 48 additional status

This outlines the most important alerts in the HART® command 48 Additional Status Field for 248 Wireless transmitter. The information in this section can be used by DeltaV™ for alert monitoring, and in the Rosemount 1420 Smart Wireless Gateway for Additional Status mapping in Modbus®, OPC, etc.

A complete list of Additional Status bits is available in the Rosemount 1420 Smart Wireless Gateway.

Table C-1 to Table C-3 shows a list of the most important alert messages that may be displayed in the AMS® Wireless Configurator and Field Communication together with the location of the Alert in the HART command 48 Additional Status field. For recommendation actions refer to Table 6-1. on page 57.

To view Active Alerts, from the Home screen, go to Service Tools > Active Alerts.

**Table C-1. Failure Alerts (F:)**

<table>
<thead>
<tr>
<th>Message</th>
<th>Additional status(1)</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Electronics Failure</td>
<td>Byte 8 :: Bit 6</td>
<td>An electronics error that could impact the device measurement reading has occurred</td>
</tr>
<tr>
<td>Terminal Block Failure</td>
<td>Byte 3 :: Bit 3</td>
<td>A critical failure has occurred in the transmitter’s terminal block</td>
</tr>
<tr>
<td>Sensor Failure</td>
<td>Byte 3 :: Bit 7</td>
<td>The device has detected an open, short, or too much resistance for this sensor</td>
</tr>
<tr>
<td>Radio Failure</td>
<td>Byte 1 :: Bit 1, Byte 1 :: Bit 7</td>
<td>The wireless radio has detected a failure or stopped communicating</td>
</tr>
<tr>
<td>Supply Voltage Failure</td>
<td>Byte 6 :: Bit 3</td>
<td>The supply voltage is too low for the device to broadcast</td>
</tr>
</tbody>
</table>

(1) Location of the Alert in the HART command 48 Status field.

C.2 Mapping of device variables index numbers

To integrate a device into the host system, it may be necessary to know what each device variable represents, and what index number it has been assigned to. The variable index number is an arbitrary number that is used to uniquely identify each variable that is supported in the field device.

Table C-4 to Table C-5 displays the device variable and variable mapping indexes for the 248 Wireless transmitter.

Table C-4. Device Variable Index

<table>
<thead>
<tr>
<th>Device variable index</th>
<th>Description</th>
